

Selling the Invisible

A Data-Driven Approach for Enabling In-Memory Computing for Edge AI

Andrei Roibu

Software Engineer
Synthara AG *

The Adoption Gap

For new IMC hardware, customers need pre-silicon, workload and SoC-specific evidence. Without it, ROI remains uncertain, and decisions stall. Hardware flexibility creates a business challenge.

Solving the “Flexibility Paradox”

The team replaced specification-led discussions with calibrated, workload-specific evidence. By linking customer workloads and SoC specifications to comparable performance reports, the workflow shortened evaluation cycles and turned abstract claims into concrete sizing and integration discussions.

Data-Driven Transformations

Lessons Learned

Customers need solutions, not IP

Generic metrics do not close deals

Evidence reduces design-space anxiety

Modularity favors cross-functional alignment
